

Claims

- [c1] 1. An apparatus for supporting a hand held liquid dispensing device comprising:
a first support member for receiving a nozzle portion of the dispensing device; and
a second support member for holding a container, the first and second support members being spaced from each other in substantial axial alignment and connected to a frame member for connection to a supporting structure.
- [c2] 2. The apparatus as defined in Claim 1 wherein the first support member includes a cavity.
- [c3] 3. The apparatus as defined in Claim 1 wherein the second support member is pivotably connected to the frame member.
- [c4] 4. The apparatus as defined in Claim 1 wherein there are two oppositely disposed first support members connected to the frame member.
- [c5] 5. The apparatus as defined in Claim 1 wherein the first support member is defined by a platform having a cavity for placement of a dispenser nozzle therein.

- [c6] 6. The apparatus as defined in Claim 1 wherein the second support member is defined by a foot portion, the foot portion supported by the frame and pivotally connected to the frame member.
- [c7] 7. The apparatus as defined in Claim 6 wherein the foot portion includes a concave portion for receiving a bottle.
- [c8] 8. The apparatus as defined in Claim 1 wherein there are two oppositely disposed second support members connected to the frame member, the frame member defined by a first portion extending in a first direction and a second portion extending essentially at right angles to the first portion, the second portion connected to the two oppositely disposed second support members.
- [c9] 9. The apparatus as defined in Claim 8 wherein the frame member is composed of rod members.
- [c10] 10. The apparatus as defined in Claim 1 wherein the cavity includes a passage constructed and arranged to permit passage of the nozzle portion therethrough.
- [c11] 11. A combined hand held liquid dispensing device and apparatus for supporting the device comprising:
a liquid dispensing device;
a first support member receiving a nozzle portion of the

dispensing device; and

a second support member for holding a container, the first and second support members being spaced from each other in substantial axial alignment and connected to a frame member for connection to a supporting structure.

[c12] 12. The apparatus as defined in Claim 11 wherein the first support member includes a cavity.

[c13] 13. The apparatus as defined in Claim 11 wherein the second support member is pivotably connected to the frame member.

[c14] 14. The apparatus as defined in Claim 11 wherein there are two oppositely disposed first support members connected to the frame member.

[c15] 15. The apparatus as defined in Claim 11 wherein the first support member is defined by a platform having a cavity for placement of a dispenser nozzle therein.

[c16] 16. The apparatus as defined in Claim 11 wherein the second support member is defined by a foot portion, the foot portion supported by the frame and pivotally connected to the frame member.

[c17] 17. The apparatus as defined in Claim 16 wherein the

foot portion includes a concave portion for receiving a bottle.

[c18] 18. The apparatus as defined in Claim 11 wherein there are two oppositely disposed second support members connected to the frame member, the frame member defined by a first portion extending in a first direction and a second portion extending essentially at right angles to the first portion, the second portion connected to the two oppositely disposed second support members.

[c19] 19. The apparatus as defined in Claim 18 wherein the frame member is composed of rod members.

[c20] 20. The apparatus as defined in Claim 11 wherein the cavity includes a passage constructed and arranged to permit passage of the nozzle portion therethrough.

[c21] 21. An apparatus for supporting a hand held liquid dispensing device comprising:
a first support member for receiving a nozzle portion of the dispensing device; and
a second support member for holding a container, the first and second support members being spaced from each other in substantial axial alignment and connected to a frame member for connection to a supporting structure, the frame member including a third support mem-

ber for the dispensing device.

- [c22] 22. The apparatus as defined in Claim 21 wherein the frame member includes a side portion connected to the third support member.
- [c23] 23. The apparatus as defined in Claim 22 wherein the side portion angles inwardly in a direction from the third support member toward the first support member.
- [c24] 24. The apparatus as defined in Claim 23 wherein the side portions are constructed and arranged to accommodate containers of different sizes.
- [c25] 25. The apparatus as defined in Claim 21 wherein there are two oppositely disposed first, second and third support members connected to the frame member.
- [c26] 26. The apparatus as defined in Claim 21 wherein the second support member is pivotally connected to the frame member.
- [c27] 27. The apparatus as defined in Claim 26 further including a funnel for placement in the first support member.
